Behavior-based robotics sets itself apart from traditional artificial intelligence by using biological systems as a model. Classic artificial intelligence typically uses a set of steps to solve problems, it follows a path based on internal representations of events compared to the behavior-based approach. Rather than use preset calculations to tackle a situation, behavior-based robotics relies on adaptability.

CS 378: Autonomous Intelligent Robotics

Behavior-Based Robotics (Brooks, 1996) sensors actuators. manipulate the world. build maps. explore. avoid hitting things. locomote. The Behavior-Based approach states that intelligence is the result of the interaction among an asynchronous set of behaviors and the environment. The keystone ideas behind this approach are:
•Embodiment •Situatедness

Behavior-Based Robotics—Bio-Inspired Artificial Intelligence

Behavior-based robotics The quest to generate intelligent machines has now (2007) been underway for about a half century. While much progress has been made during this period of time, the intelligence of most autonomous robots in use today reaches, at best, the level of insects, rather than the level of humans. Indeed, during the

Behavior-based Robotics?? ? Behavior is what an external observer sees a robot doing. ? Robots are programmed to display desired behavior. ? Behavior is a result of a sequence of robot actions. ? Observing behavior may not tell us much about the internal control of a robot. ? Control can be a black box. 6.

Swarm robotics is an approach to the coordination of multiple robots as a system which consist of large numbers of mostly simple physical robots.It is supposed that a desired collective behavior emerges from the interactions between the robots and interactions of robots with the environment. This approach emerged on the field of artificial swarm intelligence, as well as the biological studies ...

How it's using AI: Hanson Robotics is an AI and robotics company creating human-like robots that not only have human appearances but also characteristics like eye contact, facial recognition, speech and the ability to hold natural conversations. Using a proprietary nanotechnology skin called Frubber, the robots can produce high-quality expressions that offers a less mechanical robotic experience.

Because we cannot fully predict how socially intelligent AI will be applied, it is important to conduct research into how sensitive humans are to behaviors of humans compared to those produced by AI. This paper presents results from a behavioral Turing Test, in which participants interacted with a human, or a simple or "social" AI within a complex videogame environment.
