Control System: Block Diagrams Reduction using MATLAB. June 19, 2012. Most of the circuits in Control System today are represented by simple blocks that help us understand the function of each block in a better way. It also helps the designers to easily make amendments in the circuit for better functionality and testing purpose.

Let us discuss these rules, one by one for reduction of control system block diagram. If you're looking to do some control systems study, check out our control systems MCQs . If the transfer function of input of control system is $R(s)$ and the corresponding output is $C(s)$, and the overall transfer function of the control system is $G(s)$, then the control system can be represented as:

Simplify the block diagram shown in Figure 3-42. Solution. First, move the branch point of the path involving H_1 outside the loop involving H_2 , as shown in Figure 3-43(a). Then eliminating two loops results in Figure 3-43(b). Combining two blocks into one gives Figure 3-33(c). A-3-2. Simplify the block diagram shown in Figure 3-13.

EXAMPLE PROBLEMS AND SOLUTIONS

Block diagram reduction is mostly a (control or signals and systems) textbook exercise, if one thinks about LTI (linear time-invariant) systems. If you want to extract the transfer function from a LTI system block description, use Mason's rule (Mason's gain formula - Wikipedia) because it is faster and simpler.

The block diagram of a practical feedback control system is often quite complicated. It may include several feedback or feedforward loops, and multiple inputs. By means of systematic block diagram reduction, every multiple loop linear feedback system may be reduced to canonical form.
