The alloy-diffused AF114, AF115, AF116 and AF117 transistors were introduced in the early 1960s. There is an AF118, but this is not found in transistor radios - it's a high voltage transistor intended for use in video circuits, but it is occasionally found elsewhere (for example, the Leak Stereo 30 hi-fi amplifier).

A transistor is like a diode with a third layer of either p-type or n-type semiconductors on one end. Thus, a transistor has three regions rather than two. The interface between each of the regions forms a p-n junction. So another way to think of a transistor is as a semiconductor with two p-n junctions.
