Water covers more than 70% of the Earth's surface, making maritime influences an important consideration in evaluating modern global economic systems. Therefore, the efficient design, operation, and management of maritime systems are important for sustainable marine technology

development and green innovation. Marine Technology and Sustainable Development: Green Innovations examines theoretical frameworks and empirical research in the maritime industry, evaluating new technologies, methodologies, and practices against a backdrop of sustainability. This critical reference encourages the discussion and exploration of diverse opinions on the benefits and challenges of new marine technologies essential for marine and maritime professionals, researchers, and scholars hoping to improve their understanding of environmental considerations in preserving the world's oceanic resources.

Simulation continues to be a growth area in transportation human factors. From empirical studies in the

Laboratory to the latest training techniques in the field, simulators offer myriad benefits for the experimenter and the practitioner. This book draws together current trends in research and training simulators for the road, rail, air and sea sectors to inform the reader how to maximize both validity and cost-effectiveness in each case. *Simulators for Transportation Human Factors* provides a valuable resource for both researchers and practitioners in transportation human factors on the use of simulators, giving readers concrete examples and case studies of how simulators have been developed and used in empirical research as well as training applications. It offers useful and usable information on the functional requirements of simulators without the need for any background knowledge

Training The Power To on the technical aspects, focusing on the state of the art of research and applications in transport simulators rather than the state of the art of simulation technology. The book covers simulators in operational terms instead of task simulation/modelling and provides a useful balance between a bottom-up, academic approach and a top-down, practical perspective.

Contemporary time has seen alarming environmental revolt that is calls for attention and concern about the biosphere world, a condition that calls for need to use advantage of human improved knowledge and civilization in science engineering to develop proactive, efficient and predictive based system that meet reliability and sustainability requirement as well to

reduce uncertainty components of system design. Proactive based philosophy under safety and environmental framework should be exercise on all level of system life cycle, including design, construction, operation and disposal. Selection of all element of the life cycle should be responsibly done and pollution impact of the system to the environment and community should be mitigated. The book present application of risk and reliability analysis to various cases of marine system and subsystem, application of risk method ranging from qualitative, quantitative to simulation and analytical approach is presented.
