 $r(F + G) = rF + rG$
 $r(F \cdot G) = rF \cdot G + F \cdot rG$
Proposition. We have the following Leibnitz properties: $r(fg) = (rf)g + f(rg)$

where n_i are the components of a unit vector. (b) The tensor T is defined by $T_{ij}(y) = \int_S x_i x_j \exp(-c y^2) dA(x)$; where S is the surface of the unit sphere, y is the position vector of a point on S , and c is a constant. Deduce, with brief reasoning, that the components of T can be written in the form (1) with $n_i = y_i$. [You may quote any results derived in part (a).]

If we define S as in the above examples but with the additional restriction $z \geq 0$, then ∂S is the circle $x^2 + y^2 = c$, $z = 0$. Part IA - Vector Calculus (Definitions)

differentiation and integration of vector fields, primarily in 3-dimensional Euclidean space \mathbb{R}^3 . The term "vector calculus" is sometimes used as a synonym for the broader subject of multivariable calculus, which includes vector calculus as well as partial differentiation and multiple integration. Vector calculus plays an important role in differential geometry and in the study of partial differential equati
