The belief that the underlying order of the world can be expressed in mathematical form lies at the very heart of science. In other words, we only know what we can describe through mathematical models. Casting of metals has evolved first as witchcraft, to gradually become an art, then a technology, and only recently a science.

Casting is an engineering manufacturing process generally used for mass production in which materials in a molten state are poured into a mold where they solidify. In this process, complex parts can be manufactured economically and rapidly that otherwise would involve a lot of time if produced by other methods like shaping or cutting.

Common casting materials are aluminum, bronze, and brass. For investment casting, the first step is to create an alginate or silicone rubber impression of the object, so multiple wax replicas can be created. These wax objects are attached to a "tree" of wax, creating a structure that can be encased in plaster to make the final metal mold.
