Surgical Management Of Acute Spine

Surgery is performed in the setting of SCI, with the goals of decompressing the spinal cord and restoring spinal stability. Although a consensus regarding the optimal timing of surgical decompression for SCI has not been reached, much of the preclinical and clinical evidence, as well as a recent international survey of spine surgeons, support performing early surgery (<24 hours).

Surgical Management of Acute Spine Injuries

Acute spinal cord compression (ASCC) is a surgical emergency requiring immediate neurosurgical treatment. Prognosis of the condition can vary and is most dependent on the time between diagnosis and treatment. In this article, we shall look at the risk factors, clinical features and management of acute spinal cord compression.

Medical and surgical management of acute spinal injury ...

Acute spinal cord injury (SCI) is a traumatic event that results in disturbances to normal sensory, motor, or autonomic function and ultimately affects a patient's physical, psychological, and social well-being. The management of patients with SCI has drastically evolved over the past century as a result of increasing knowledge on injury mechanisms, disease pathophysiology, and the role of surgery.

---

A Clinical Practice Guideline for the Management of Acute ...

The recent Surgical Timing in Acute Spinal Cord Injury Study showed improved outcomes at 6 months with early (<24 h from injury) when compared with late intervention (≥24 h).<sup>33</sup> While early spinal decompression may provide neurological benefit, spinal stabilisation generally allows the patient to mobilise earlier. Many surgeons feel that this mobilisation decreases early complications.

Acute management of traumatic cervical spinal cord injury ...

Indications for surgery: An acute subdural hematoma (SDH) with a thickness greater than 10 mm or a midline shift greater than 5 mm on computed tomographic (CT) scan should be surgically evacuated, regardless of the patient's Glasgow Coma Scale (GCS) score.

---

Surgical management of acute subdural hematomas

Spinal fusion surgery can be used to fuse 2 vertebrae together to strengthen them. This can also help to reduce any related nerve pain as it stops the damaged vertebrae squeezing the nerves that pass through the spine. It's possible that this type of surgery could cause permanent damage to some of the nerves in your back.

A Clinical Practice Guideline for the Management of ...

OVERVIEW Incidence. Since the introduction of CT scanning as the imaging study of choice to detect intracranial lesions after trauma, the incidence of surgical and nonsurgical EDH among traumatic brain injury (TBI) patients has been reported to be in the range of 2.7 to 4% (8, 11, 25, 41). Among patients in coma, up to 9% harbored an EDH requiring craniotomy (10, 35).

---

Surgical Management of Acute Epidural Hematomas ...

Early neurosurgical decompression of acute spinal cord compression (< 72 hours) is recommended. Consider early tracheostomy (< 7 days) in high cervical injury (C1-C5) patients. Rehabilitation should be offered to all patients.
