This UFC provides guidance for Department of Defense facilities to achieve high performance and sustainable building requirements in compliance with the Energy Policy Act of 2005, the Energy Independence and Security Act of 2007, EO 13423, EO 13514, and the Guiding Principles for Federal Leadership in High Performance and Sustainable Buildings (Guiding Principles).

The purpose of this manual is to present basic principles used in the design and construction of earth levees. The term levee as used herein is defined as an embankment whose primary purpose is to furnish flood protection from seasonal high water and which is therefore subject to water loading for periods of only a few days or weeks a year. Embankments that are subject to water loading for prolonged periods (longer than normal flood protection requirements) or permanently should be designed in accordance with earth dam criteria rather than the levee criteria given herein. Even though levees are similar to small earth dams they differ from earth dams in the following important respects: (a) a levee embankment may become saturated for only a short period of time beyond the limit of capillary saturation, (b) levee alignment is dictated primarily by flood protection requirements, which often results in construction on poor foundations, and (c) borrow is generally obtained from shallow pits or from channels excavated adjacent to the levee, which produce fill material that is often heterogeneous and far from ideal. Selection of the levee section is often based on the properties of the poorest material that must be used.

EM-385-1-1 manual is vital in getting and maintaining work on government contracts. It includes all safety and health requirements for all Corps of Engineers activities and operations, including Naval Facilities Engineering Command (NAVFAC) construction and Department of Defense projects.
